

# Analiziranje rezultata teniskih mečeva

Luka Raić, Anđelko Prskalo, Martin-Ante Rogošić, Katarina Zec

2024-01-21

## Sadržaj

1	Definicija zajednički korištenih podataka i funkcija:	1
2	1. istraživačko pitanje: Kakva je distribucija mečeva na specifičnim podlogama u različitim godišnjim dobima?	2
3	3. istraživačko pitanje: Ima li razlike u broju serviranih asova na različitim podlogama?	3
	3.1 Učitavanje podataka	3
	3.2 Prilagodba tipova podataka	3
	3.3 Statistička analiza	4
	3.4 Zaključak	13
4	6. istraživačko pitanje: U kojoj je mjeri moguće predvidjeti ishod teniskog meča?	13
	4.1 Uvod	13
	4.2 Obrada skupa podataka	16
	4.3 Treniranje modela, predikcija i zaključak	708
5	4. istraživačko pitanje: Kakva je veza između vrste terena i vjerojatnosti da će mečevi otići u 5. set?	710
6	7. istraživačko pitanje: Postoji li razlika u broju odigranih aseva između igrača koji su osvojili Grand Slam naslov i onih koji nisu?	711
	6.1 Učitavanje podataka	711
	6.2 Prilagodba tipova podataka	711
	6.3 Statistička analiza	712
	6.4 Zaključak	720

## 1 Definicija zajednički korištenih podataka i funkcija:

Funkcije za dohvat podataka i željenog perioda:

```
fetch_data <- function(years) {  
  
  df_list <- list()  
  for (year in years) {  
    file_path <- paste0("./ATP-Matches/atp_matches_", year, ".csv")  
    if (file.exists(file_path)) {  
      df <- read_csv(file_path, col_types = "cccncncnnccncncnnccncncncnnnnnnnnnnnnnnnnnnnnnn", show_col_types = FALSE)  
      df_list[[as.character(year)]] <- df  
    } else {  
      warning(paste("File not found for year", year))  
    }  
  }  
}  
  
matches <- bind_rows(df_list)
```

```
rm(df_list, file_path, df, year, years)

matches
}
```

## 2 1. istraživačko pitanje: Kakva je distribucija mečeva na specifičnim podlogama u različitim godišnjim dobima?

Dohvaćamo potrebne podatke i malo uređujemo:

```
matches <- fetch_data(1968:2023)

matches$tourney_date <- ymd(matches$tourney_date)
matches <- filter(matches, !is.na(surface))
```

Za svaku observaciju određujemo kojem godišnjem dobu pripada:

```
getSeason <- function(DATES) {
  WS <- as.Date("2012-12-15", format = "%Y-%m-%d") # Winter Solstice
  SE <- as.Date("2012-3-15", format = "%Y-%m-%d") # Spring Equinox
  SS <- as.Date("2012-6-15", format = "%Y-%m-%d") # Summer Solstice
  FE <- as.Date("2012-9-15", format = "%Y-%m-%d") # Fall Equinox

  d <- as.Date(strftime(DATES, format="2012-%m-%d"))

  ifelse (d >= WS | d < SE, "Winter",
    ifelse (d >= SE & d < SS, "Spring",
      ifelse (d >= SS & d < FE, "Summer", "Fall")))
}

matches$season <- getSeason(matches$tourney_date)
```

Izvlacenje potrebnih podataka i njihova vizualizacija:

```
ggplot(matches, aes(x = surface)) +
  geom_bar() + theme_bw() +
  facet_wrap(season ~ ., nrow = 2, ncol = 2) +
  labs(title = "Distribution of Matches on Specific Surfaces in Different Seasons",
    x = "Surface", y = "Number of Matches")
```

Distribution of Matches on Specific Surfaces in Different Seasons

### 3. istraživačko pitanje: Ima li razlike u broju serviranih asova na različitim podlogama?

#### 3.1 Učitavanje podataka

Podatke ćemo učitati iz CSV datoteka u listu podatkovnih okvira. Svaki podatkovni okvir sadržava podatke mečeva jedne godine. Nakon toga spajamo sve podatkovne okvire u jedan te time imamo informacije o svim odigranim mečevima od 1968. do 2023. godine dostupne u jednom podatkovnom okviru. Iz tog okvira ćemo naknadno izvlačiti potrebne podatke za svrhe analize.

Proces učitavanja podataka je prikazan u sljedećem bloku koda:

```
matches <- fetch_data(1968:2023)
```

#### 3.2 Prilagodba tipova podataka

Nakon učitavanja podataka, potrebno je ispraviti tipove podataka za neke stupce. Ti stupci su:

- **surface** - podloga na kojoj se igrao meč: trava, zemlja, tvrda podloga, tepih (eng. grass, clay, hard, carpet)
- **tourney\_level** - razina turnira: Grand Slam, ATP Finals, ATP Masters 1000, ATP Tour, ATP Challengers
- **tourney\_date** - datum održavanja turnira
- **winner\_hand** - ruka s kojom je pobjednik igrao meč: desnoruk, lijevoruk, ambidekster, nepoznato (eng. right-handed ("R"), left-handed ("L"), ambidextrous ("A"), unknown ("U"))
- **loser\_hand** - ruka s kojom je gubitnik igrao meč (definirano isto kao i za winner\_hand)

Prilagodba tipova podataka je prikazana u sljedećem kodu:

```
matches$surface <- factor(
  matches$surface,
  levels = c("Grass", "Clay", "Hard", "Carpet")
)
```

```

)
matches$tourney_level <- factor(
  matches$tourney_level,
  levels = c("F", "A", "D", "M", "G")
)
matches$tourney_date <- ymd(matches$tourney_date)
matches$winner_hand <- factor(
  matches$winner_hand,
  levels = c("R", "L", "A", "U")
)
matches$loser_hand <- factor(
  matches$loser_hand,
  levels = c("R", "L", "A", "U")
)

```

### 3.3 Statistička analiza

#### 3.3.1 Priprema podataka

Za provođenje statističke analize, potrebno je pripremiti podatke. U ovom slučaju, potrebno je izvući podatke o broju serviranih asova po meču i podlogama na kojima se igrao meč. Također, potrebno je ukloniti sve mečeve koji nemaju podatak o broju serviranih asova ili podlogama na kojima se igrao meč.

Podatke spremamo u nove podatkovne okvire od kojih svaki predstavlja aseve na jednoj podlozi:

```

# izdvajanje broja serviranih asova na travnatoj podlozi
aces_grass <- matches %>%
  filter(!is.na(w_ace) & !is.na(l_ace) & surface == "Grass") %>%
  mutate(aces = w_ace + l_ace) %>%
  dplyr::select(aces)

# izdvajanje broja serviranih asova na zemljanoj podlozi
aces_clay <- matches %>%
  filter(!is.na(w_ace) & !is.na(l_ace) & surface == "Clay") %>%
  mutate(aces = w_ace + l_ace) %>%
  dplyr::select(aces)

# izdvajanje broja serviranih asova na tvrdoj podlozi
aces_hard <- matches %>%
  filter(!is.na(w_ace) & !is.na(l_ace) & surface == "Hard") %>%
  mutate(aces = w_ace + l_ace) %>%
  dplyr::select(aces)

# izdvajanje broja serviranih asova na tepihu
aces_carpet <- matches %>%
  filter(!is.na(w_ace) & !is.na(l_ace) & surface == "Carpet") %>%
  mutate(aces = w_ace + l_ace) %>%
  dplyr::select(aces)

# izdvajanje broja serviranih asova na svim podlogama
aces_all <- matches %>%
  filter(!is.na(w_ace) & !is.na(l_ace) & !is.na(surface)) %>%
  mutate(aces = w_ace + l_ace) %>%
  dplyr::select(aces)

```

#### 3.3.2 Deskriptivna statistika

Sada kada smo pripremili podatke, možemo izračunati deskriptivnu statistiku za broj serviranih asova po podlogama. Za svaku podlogu, izračunat ćemo sljedeće vrijednosti za svaku od podloga:

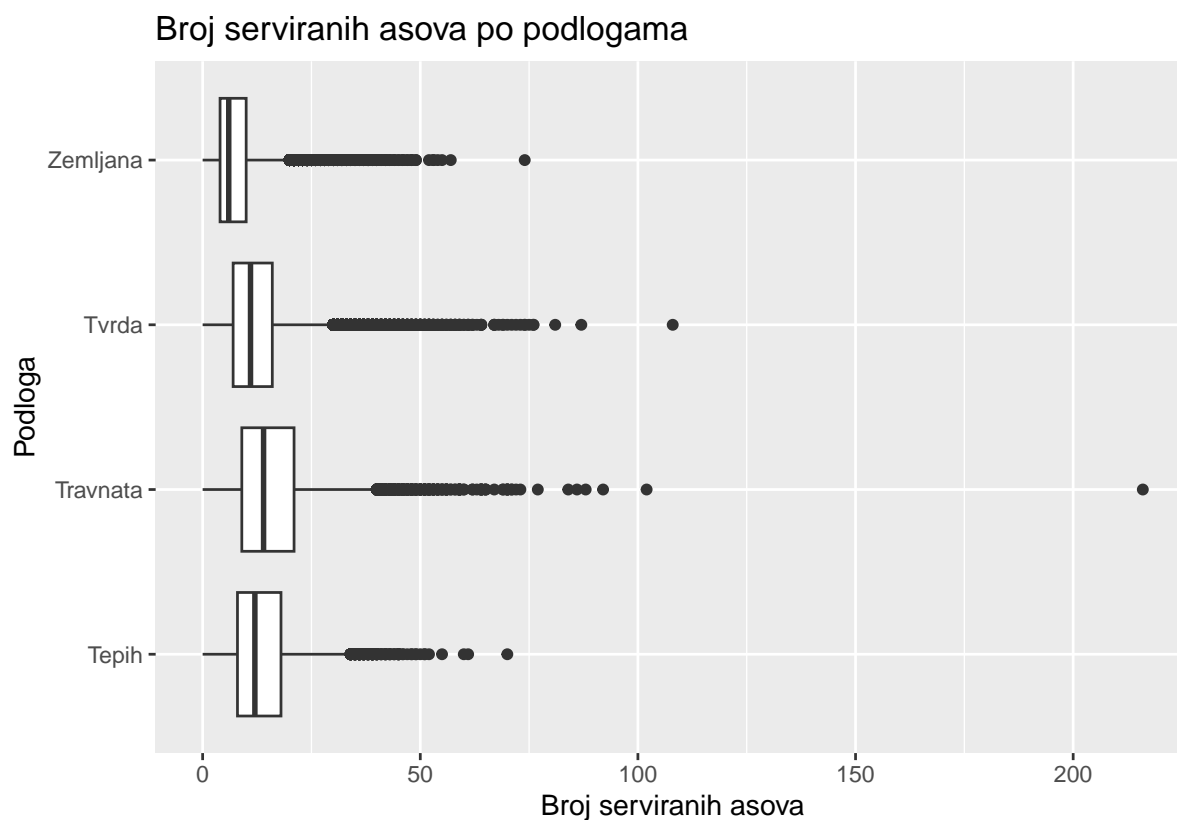

- prosjecni broj asova
- standardnu devijaciju broja asova
- medijan broja asova
- minimalni broj asova
- maksimalni broj asova
- broj mečeva

Table 1: Servirani asovi po podlogama

surface	mean	sd	median	min	max	count
Tepih	13.36	7.95	12	0	70	5878
Travnata	16.16	10.22	14	0	216	9783
Zemljana	7.62	5.65	6	0	74	31085
Tvrda	12.58	8.08	11	0	108	47729
Ukupno	11.37	8.14	10	0	216	94475

Iz prikazanih vizualizacija, možemo vidjeti kako je, u prosijeku, najviše asova servirano na travi, a najmanje na zemlji. Također, možemo vidjeti kako je na travi servirano najviše asova u jednom meču, a na tepihu najmanje. Najveću varijancu broja serviranih asova po meču imamo na travi.

Ove podatke možemo vizualizirati pomoću boxplot dijagrama i dijagrama gustoće.

Iz prikazanih boxplot dijagrama i dijagrama gustoće možemo vidjeti kako je distribucija svih uzoraka jako nakošena u lijevo što znači da je većina uzoraka blizu minimalne vrijednosti.

Kako bismo pokušali normalizirati distribucije, možemo izbaciti sve observacije s vrijednostima izvan 1.5 interkvartilnog raspona (outlier-e).

Table 2: Servirani asovi po podlogama nakon izbacivanja outlier-a

surface	mean	sd	median	min	max	count
Tepih	12.68	6.79	11	0	33	5729
Travnata	15.08	8.13	14	0	39	9470
Tvrda	11.59	6.39	11	0	29	45839
Zemljana	6.91	4.35	6	0	19	29866

Nakon izbacivanja outlier-a, distribucije su i dalje nakošene u lijevo, ali je to manje izraženo nego prije. Također možemo vidjeti kako je sada varijanca svake podloge manja nego prije.

### 3.3.3 Statističko testiranje

Nakon vizualiziranja podataka i izbacivanja outlier-a, možemo provesti statističko testiranje. Budući da distribucije uzoraka ne izgledaju kao da potječu iz normalne distribucije, prvo ćemo provjeriti njihovu normalnost, a zatim na temelju ishoda testa odlučiti koji test ćemo koristiti za provođenje statističkog testiranja.

**3.3.3.1 Testiranje normalnosti** Za testiranje normalnosti koristit ćemo Kolmogorov-Smirnovljev test. Testirat ćemo normalnost svih uzoraka zajedno, a zatim svakog uzorka posebno.

Prije testiranja, postavljamo hipoteze:

- $H_0$ : distribucija uzorka je normalna
- $H_1$ : distribucija uzorka nije normalna

Za razinu značajnosti uzimamo 0.05.

```
##  
## Asymptotic one-sample Kolmogorov-Smirnov test  
##  
## data: aces_all$aces  
## D = 0.10114, p-value < 2.2e-16  
## alternative hypothesis: two-sided
```

### Servirani asovi na travnatoj podlozi

```
##  
## Asymptotic one-sample Kolmogorov-Smirnov test  
##  
## data: aces_grass$aces  
## D = 0.091126, p-value < 2.2e-16  
## alternative hypothesis: two-sided
```

### Servirani asovi na zemljanoj podlozi

```
##  
## Asymptotic one-sample Kolmogorov-Smirnov test  
##  
## data: aces_clay$aces  
## D = 0.11556, p-value < 2.2e-16  
## alternative hypothesis: two-sided
```

### Servirani asovi na tvrdoj podlozi

```
##  
## Asymptotic one-sample Kolmogorov-Smirnov test  
##  
## data: aces_hard$aces  
## D = 0.093996, p-value < 2.2e-16  
## alternative hypothesis: two-sided
```

### Servirani asovi na tepihu

```
##
## Asymptotic one-sample Kolmogorov-Smirnov test
##
## data: aces_carpet$aces
## D = 0.099377, p-value < 2.2e-16
## alternative hypothesis: two-sided
```

Iz prikazanih dijagrama i rezultata testiranja možemo vidjeti kako distribucije uzoraka nisu normalne. Stoga ćemo za statističko testiranje koristiti neparametarske testove.

**3.3.3.2 Neparametarsko testiranje** Za neparametarsko testiranje koristit ćemo Kruskal-Wallisov test. Prije testiranja, postavljamo hipoteze:

- $H_0$ : nema razlike u broju serviranih asova na različitim podlogama
- $H_1$ : postoji razlika u broju serviranih asova na različitim podlogama

Za razinu značajnosti uzimamo 0.05.

```
##
## Kruskal-Wallis rank sum test
##
## data: aces by surface
## Kruskal-Wallis chi-squared = 15060, df = 3, p-value < 2.2e-16
```

Iz rezultata testiranja možemo vidjeti kako je p-vrijednost manja od 0.05, stoga odbacujemo nultu hipotezu i zaključujemo kako postoji razlika u broju serviranih asova na različitim podlogama.

Kako bismo saznali na kojim podlogama postoji razlika u broju serviranih asova, provest ćemo post-hoc testiranje. Za post-hoc testiranje koristit ćemo Dunnov test.

```
##
## Comparison of x by group
## (Bonferroni)
## Col Mean-|
## Row Mean | Tepih Travnata Tvrda
```

```
## -----+-----
## Travnata | -14.68551
##          | 0.0000*
##          |
## Tvrda | 10.50965 34.82310
##         | 0.0000* 0.0000*
##         |
## Zemljana | 62.56852 97.36533 101.5528
##          | 0.0000* 0.0000* 0.0000*
##
## alpha = 0.05
## Reject Ho if p <= alpha/2
```

Iz rezultata testiranja možemo vidjeti kako je p-vrijednost manja od 0.05 za sve kombinacije podloga, stoga odbacujemo nultu hipotezu za sve kombinacije podloga i zaključujemo kako postoji razlika u broju serviranih asova na svim kombinacijama podloga.

### 3.4 Zaključak

Na temelju provedene statističke analize, možemo zaključiti kako postoji razlika u broju serviranih asova na različitim podlogama. Štoviše, postoji razlika u broju serviranih asova na svim kombinacijama podloga. Najviše asova servirano je na travi, a najmanje na zemlji. Također, najveća varijanca broja serviranih asova po meču je na travi, a najmanja na tepihu.

## 4 6. istraživačko pitanje: U kojoj je mjeri moguće predvidjeti ishod teniskog meča?

### 4.1 Uvod

Kako bi odgovorili na ovo pitanje, u analizi smo se fokusirali na teniske mečeve iz perioda 2010-2020 (mečevi “modernog tenisa” za koje imamo većinu podataka za veliki broj varijabli, Novak Đoković je 2011. osvojio 3/4 Grand Slam turnira i počela je formacija tzv. “Velike trojke”...) pri čemu nećemo uzimati u obzir mečeve Olimpijskih igara, Davis Cup-a i ATP Tour Finals-a zbog drugačijeg formata (ovo su jedini turniri za koje smo našli da su drugačijeg formata, vrlo je vjerojatno da ih ima još, ali izgleda da nam nisu stvarali previše problema kasnije):

```
matches <- fetch_data(2010:2020)

matches$tournament_name %>%
  str_detect("(Olympics|Davis Cup|Finals)") %>%
  which -> differentFormatMatchesIndices
matches <- matches[-differentFormatMatchesIndices,]
```

Za predikciju ishoda meča koristit ćemo sljedeće varijable (vrijednosti varijabli sa oznakom \* izračunavamo na temelju svih mečeva tenisača koji su odigrani prije meča za koji računamo odgovarajuću statistiku):

- height - visina igrača. Viši igrači imaju brži i efikasniji servis, lakše pokrivaju teren, bolja igra na mreži.
- age - broj godina. Veći broj godina donosi iskustvo, ali potencijalno i lošije fizičke sposobnosti.
- rank - rang na ATP ljestvici. Indikator sveukupne kvalitete igrača.
- avgAce\* - prosječan broj asova po meču. Indikator kvalitete servisa tenisača.
- avgDf\* - prosječan broj dvostrukih pogrešaka po meču. Indikator sklonosti pogreškama.
- avgSvptWon\* - prosječan omjer osvojenih poena na servisu u usporedbi s igračevim brojem odigranih poena za vlastiti servis. Indikator snažnog i efikasnog servisa.
- avgBpSavedPercentage\* - prosječan omjer “spašenih” breakpointova. Indikator mentalne snage i iskustva tenisača.
- winrate\* - postotak pobjeda u dosadašnjoj karijeri. Indikator kvalitete tenisača.
- lastTenWinrate - postotak pobjeda u zadnjih 10 mečeva. Indikator forme tenisača.

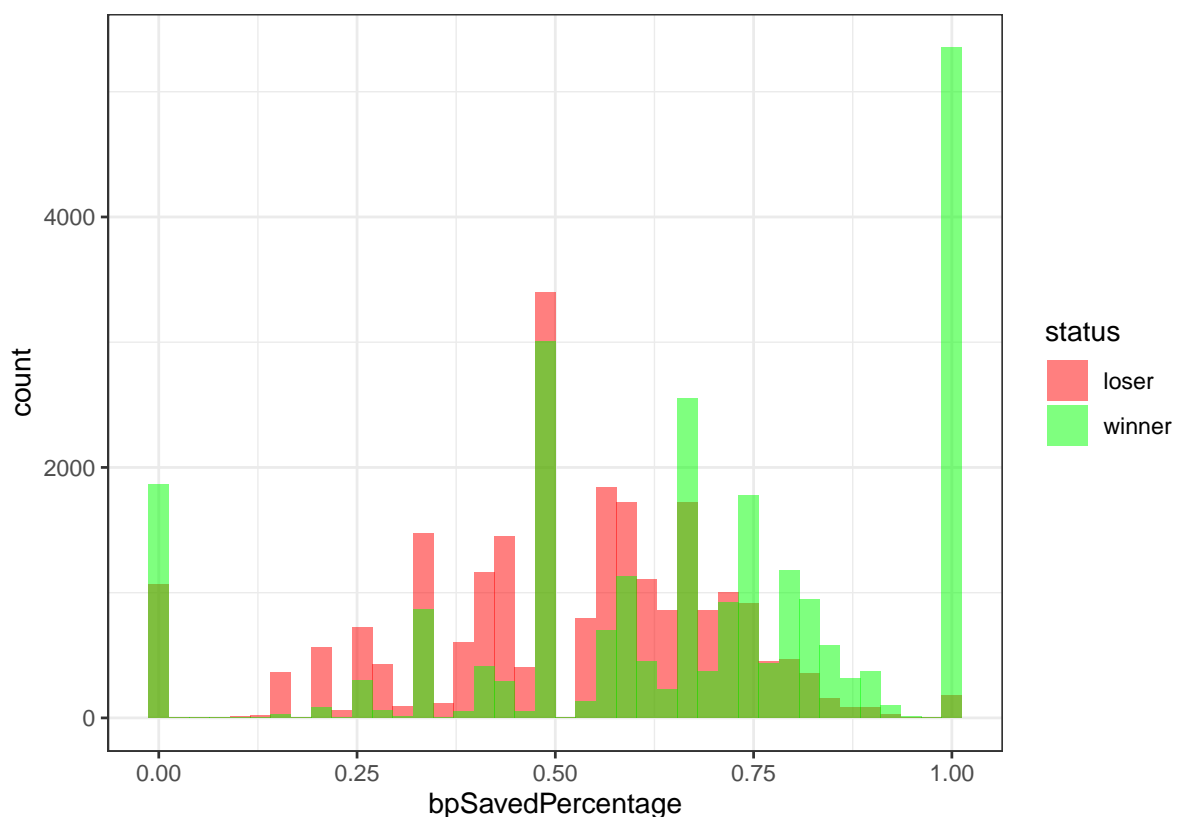

U nastavku slijede grafovi za neke od prethodno odabranih statistika čiji nam je utjecaj na konačan ishod meča bio “upitan”:

```
ifelse(matches$w_bpFaced == 0, NA,
       matches$w_bpSaved / matches$w_bpFaced) -> wBpSavedPercentage
ifelse(matches$l_bpFaced == 0, NA,
       matches$l_bpSaved / matches$l_bpFaced) -> lBpSavedPercentage

data <- data.frame(winner = wBpSavedPercentage, loser = lBpSavedPercentage)
data <- na.omit(data)
data <- gather(data, key = "status", value = "bpSavedPercentage")

plot <- ggplot(data, aes(x = bpSavedPercentage, fill = status)) +
  geom_histogram(alpha = 0.5, bins = 40, position = 'identity') +
  scale_fill_manual(values = c("winner" = "green", "loser" = "red")) + theme_bw()

plot
```

```
ifelse(matches$w_svpt == 0, NA,
       (matches$w_1stWon + matches$w_2ndWon) / matches$w_svpt) -> wSvptWonPercentage
ifelse(matches$l_svpt == 0, NA,
       (matches$l_1stWon + matches$l_2ndWon) / matches$l_svpt) -> lSvptWonPercentage

data <- data.frame(winner = wSvptWonPercentage, loser = lSvptWonPercentage)
data <- na.omit(data)
data <- gather(data, key = "status", value = "svptWonPercentage")

plot <- ggplot(data, aes(status, svptWonPercentage)) +
  geom_boxplot() + theme_bw()

plot
```

```
data <- data.frame(winner = matches$winner_age, loser = matches$loser_age)
data <- gather(data, key = "status", value = "age")

plot <- ggplot(data, aes(x = age, color = status)) +
  geom_density() + theme_bw()

plot
```

Sada ćemo izbaciti neregularne observacije:

```
faultyDataMatchesIndices <- which(
  apply(matches[, c("winner_rank", "loser_rank", "winner_ht", "loser_ht", "w_ace")],
    1, function(x) any(is.na(x)))
matches <- matches[-faultyDataMatchesIndices,]
```

te još malo pripremiti skup podataka za obradu:

```
matches$tourney_date <- ymd(matches$tourney_date)
matches <- matches %>% arrange(tourney_date, match_num)
matches$match_id <- seq(1, nrow(matches))
```

## 4.2 Obrada skupa podataka

Sada odabiremo one teniske mečeve na kojima ćemo kasnije bazirati naš logistički model. To su teniski mečevi u kojima je svaki od oba tenisača prethodno odigrao barem 10 mečeva (pojedine statistike kao što je npr. winrate su jako osjetljive na broj observacija). Ove mečeve ćemo u nastavku zvati “validni mečevi”:

```
checkIfValidForProcessing = function(match) {
  winnerId <- match["winner_id"] %>% as.numeric
  loserId <- match["loser_id"] %>% as.numeric
  matchId <- match["match_id"] %>% as.numeric

  lastMatchIndex <- matchId - 1
  if (lastMatchIndex == 0) return(FALSE)

  winnersCandidates <- pull(matches[1:lastMatchIndex, ], winner_id)
  losersCandidates <- pull(matches[1:lastMatchIndex, ], loser_id)
  playersCandidates <- c(winnersCandidates, losersCandidates)

  validPlayersIndices <- table(playersCandidates) >= 10
```

```

table(playersCandidates)[validPlayersIndices] %>% names %>% as.numeric -> validPlayers

if (winnerId %in% validPlayers && loserId %in% validPlayers) return (TRUE)

return (FALSE)
}

validMatchesIndices <- apply(matches, 1, checkIfValidForProcessing)
validMatches <- matches[validMatchesIndices, ]

```

Sada kreiramo pomoćni podatkovni okvir u kojemu će jedna observacija predstavljati statistike pojedinog igrača po pojedinom meču. NAPOMENA: ovdje gledamo performanse svakog igrača, i pobjednika i gubitnika, na svakom meču iz perioda 2010-2020 (osim na onim mečevima koje smo izbacili nakon prvog “čišćenja”):

```

allWinnersMatchStats <- matches[, c("match_id", "winner_id", "w_ace", "w_df", "w_svpt",
                                     "w_1stWon", "w_2ndWon", "w_bpSaved", "w_bpFaced")]
allWinnersMatchStats$won <- 1
names(allWinnersMatchStats) <- c("matchId", "playerId", "ace", "df", "svpt",
                                  "firstWon", "secondWon", "bpSaved", "bpFaced", "won")

allLosersMatchStats <- matches[, c("match_id", "loser_id", "l_ace", "l_df", "l_svpt",
                                    "l_1stWon", "l_2ndWon", "l_bpSaved", "l_bpFaced")]
allLosersMatchStats$won <- 0
names(allLosersMatchStats) <- c("matchId", "playerId", "ace", "df", "svpt",
                                  "firstWon", "secondWon", "bpSaved", "bpFaced", "won")

allPlayersMatchStats <- rbind(allWinnersMatchStats, allLosersMatchStats)
allPlayersMatchStats <- allPlayersMatchStats %>% arrange(matchId)

```

Kreiramo dva podatkovna okvira (jedan za pobjednika, drugi za gubitnika) koji će sadržavati podatke o godinama, visini i rang u ATP ljestvici u trenutku igranja validnog meča:

```

validMatchesWinnerInfo <- validMatches[, c("match_id", "winner_id", "winner_ht",
                                             "winner_age", "winner_rank")]
names(validMatchesWinnerInfo) <- c("matchId", "playerId", "height", "age", "rank")

validMatchesLoserInfo <- validMatches[, c("match_id", "loser_id", "loser_ht",
                                           "loser_age", "loser_rank")]
names(validMatchesLoserInfo) <- c("matchId", "playerId", "height", "age", "rank")

```

Za svaki validni meč računamo potrebne statistike za tenisača pobjednika i tenisača gubitnika na temelju svih njihovih prethodnih mečeva koji se nalaze u skupu “matches”:

```

calculateValidMatchesStats <- function(x) {

  matchId = x["matchId"] %>% as.numeric
  playerId = x["playerId"] %>% as.numeric
  height = x["height"] %>% as.numeric
  age = x["age"] %>% as.numeric
  rank = x["rank"] %>% as.numeric

  pastMatches <- allPlayersMatchStats[allPlayersMatchStats$playerId == playerId &
                                       allPlayersMatchStats$matchId < matchId,]

  avgAce <- mean(pastMatches$ace, na.rm = T)

  avgDf <- mean(pastMatches$df, na.rm = T)

  svptWonPercentage <- ifelse(pastMatches$svpt == 0, NA,

```

```

      (pastMatches$firstWon + pastMatches$secondWon) / pastMatches$svpt)
avgSvptWonPercentage <- mean(svptWonPercentage, na.rm = T)

bpSavedPercentage <- ifelse(pastMatches$bpFaced == 0, NA,
      pastMatches$bpSaved / pastMatches$bpFaced)
avgBpSavedPercentage <- mean(bpSavedPercentage, na.rm = T)

winrate <- mean(pastMatches$won, na.rm = T)

lastTenWinrate <- sum(tail(pastMatches$won, 10)) / 10

result <- c(matchId, height, age, rank, avgAce, avgDf,
      avgBpSavedPercentage, avgSvptWonPercentage, winrate, lastTenWinrate)

result
}

validMatchesWinnerData <- apply(validMatchesWinnerInfo, 1, calculateValidMatchesStats)
validMatchesWinnerData <- as.data.frame(t(validMatchesWinnerData))
colnames(validMatchesWinnerData) <- c("matchId", "height", "age", "rank", "avgAce", "avgDf", "avgBpS

validMatchesLoserData <- apply(validMatchesLoserInfo, 1, calculateValidMatchesStats)
validMatchesLoserData <- as.data.frame(t(validMatchesLoserData))
colnames(validMatchesLoserData) <- c("matchId", "height", "age", "rank", "avgAce", "avgDf", "avgBpS

```

Stvaramo 3 nova podatkovna okvira: playerOne, playerTwo i playerDifference. Prva 2 podatkovna okvira odgovaraju jedan drugom po retcima, npr. u oba okvira u retku 547 se nalaze podaci o istom meču, samo jedan od njih sadrži sve podatke o gubitniku, a drugi o pobjedniku, s tim da je okvir koji sadrži podatke za pobjednika, odnosno gubitnika, nasumično odabran. Okvir playerDifference predstavlja njihovu razliku:

```

winnerIndices <- sample(1:23101, size = length(1:23101) * 0.5, replace = FALSE)

playerOne <- rbind(validMatchesWinnerData[winnerIndices, ],
      validMatchesLoserData[-winnerIndices, ]) %>% arrange(matchId)
playerTwo <- rbind(validMatchesWinnerData[-winnerIndices, ],
      validMatchesLoserData[winnerIndices, ]) %>% arrange(matchId)
playerDifference <- playerOne - playerTwo

playerDifference$won <- 0
playerDifference[winnerIndices, "won"] <- 1
playerDifference$matchId <- NULL

playerDifference

```

## [ reached 'max' / getOption("max.print") -- omitted 13102 rows ]
```

Još je samo potrebno normalizirati podatke:

```
normalize <- function(x) {
  return ((x - min(x)) / (max(x) - min(x)))
}
playerDifference <- as.data.frame(lapply(playerDifference, normalize))

playerDifference
```

```

### 4.3 Treniranje modela, predikcija i zaključak

Dijelimo obzervacije u skupove podataka za treniranje i predikciju:

```
set.seed(123)

trainingIndices <- sample(1:nrow(playerDifference), nrow(playerDifference) * 0.7)
trainingSet <- playerDifference[trainingIndices, ]
testingSet <- playerDifference[-trainingIndices, ]
```

Provodimo logističku regresiju:

```
model <- glm(won ~ ., family = binomial(link = "logit"), data = trainingSet)
```

Sada pogledajmo ispis rezultata našeg modela:

```
summary(model)

##
## Call:
## glm(formula = won ~ ., family = binomial(link = "logit"), data = trainingSet)
##
## Coefficients:
##              Estimate Std. Error z value Pr(>|z|)
## (Intercept)   -0.27690    0.51227  -0.541 0.588822
```

```

## (Dispersion parameter for binomial family taken to be 1)
##
## Null deviance: 22416  on 16169  degrees of freedom
## Residual deviance: 19649  on 16160  degrees of freedom
## AIC: 19669
##
## Number of Fisher Scoring iterations: 3
```

Za početak bacimo pogled na stupac s imenom “Pr(>|z|)” koji nam ukazuje na to koje su se od varijabli u našem modelu pokazale statistički značajnim: za svaku varijablu nam daje P-vrijednost testa hipoteze da je pripadni koeficijent jednak 0. Možemo zaključiti da su nam za razinu značajnosti od 0.05 statistički značajne sve varijable osim height, avgDf i avgBpSavedPercentage koje ne doprinose efikasnosti modela. Sada pogledajmo koliko je naš model dobar:

```
predictions <- predict(model, newdata = testingSet, type = "response")
predictions <- ifelse(predictions > 0.5, 1, 0)

misClasificError <- mean(predictions != testingSet$won)
print(paste('Accuracy', 1 - misClasificError))
```

```
## [1] "Accuracy 0.66440629057856"
```

Preciznost od 66.3973% na skupu podataka od 6931 observacija. Ajmo sada opet provesti logističku regresiju, ali bez prethodno spomenutih varijabli:

```
set.seed(123)

indices <- c(2, 3, 4, 7, 8, 9, 10)
playerDifference <- playerDifference[, indices]
trainingIndices <- sample(1:nrow(playerDifference), nrow(playerDifference) * 0.7)
trainingSet <- playerDifference[trainingIndices, ]
testingSet <- playerDifference[-trainingIndices, ]
model <- glm(won ~ ., family = binomial(link = "logit"), data = trainingSet)
summary(model)
```

```
##

##
##      Null deviance: 22416   on 16169   degrees of freedom
## Residual deviance: 19649   on 16163   degrees of freedom
## AIC: 19663
##
## Number of Fisher Scoring iterations: 3
```

AIC vrijednost je sada malo manja, što je indikator da je ovaj model bolji. Da vidimo koliko je zapravo dobar:

```
predictions <- predict(model, newdata = testingSet, type = "response")
predictions <- ifelse(predictions > 0.5, 1, 0)

misClasificError <- mean(predictions != testingSet$won)
print(paste('Accuracy', 1 - misClasificError))
```

```
## [1] "Accuracy 0.664839128552878"
```

Sada nam je preciznost još manja (“Dikod uđe, dikod ne uđe” - Mate Baturina). Međutim, unatoč tome možemo zaključiti da je itekako moguće predvidjeti ishod teniskog meča pomoću logističke regresije.

## 5 4. istraživačko pitanje: Kakva je veza između vrste terena i vjerojatnosti da će mečevi otići u 5. set?

Ovo pitanje možemo riješiti pomoću hi-kvadrat testa homogenosti, s tim da moramo paziti da određene pretpostavke budu zadovoljene. Kako bismo to mogli provjeriti, prvo moramo izolirati željene podatke u obliku pogodnom za obradu. Za početak, idemo učitati sve potrebne podatke:

```
matches <- fetch_data(1968:2023)
matches <- matches[, c("surface", "score", "best_of")]
```

Zatim moramo eliminirati neregularne observacije: mečeve za koje ne znamo podlogu na kojoj su odigrani i/ili mečevi u kojima teoretski nije bilo moguće odigrati 5 setova (zbog samog formata natjecanja):

```
matches %>% filter(!is.na(surface), best_of == 5) -> matches
matches$best_of <- NULL
```

Sada dijelimo mečeve u 2 skupa: oni u kojima je odigrano svih 5 setova i oni u kojima nije (NAPOMENA: u ovom 2. slučaju pritom ignoriramo mečeve koji su otkazani zbog neprimjerenog ponašanja igrača, pogreške sudca u organizacijskom smislu, zbog loših vremenskih uvjeta i raznih drugih okolnosti koje “nisu vezane uz sam sport”):

```
fiveSetMatchesIndices <- which(
  !str_detect(matches$score, "[^0-9- ]") & str_count(matches$score, "-") == 5)
fiveSetsMatches <- matches[fiveSetMatchesIndices, ]

lessThanFiveSetsMatches <- matches[-fiveSetMatchesIndices, ]
lessThanFiveSetsMatches <- filter(lessThanFiveSetsMatches,
  !str_detect(score, "(Played and unfinished|Played and abandoned|W/"))
```

Sada gradimo kontingencijsku tablicu:

```
fiveSetsMatches %>% group_by(surface) %>% summarise(count = n()) -> fiveSetsMatches
lessThanFiveSetsMatches %>% group_by(surface) %>% summarise(count = n()) -> lessThanFiveSetsMatches

data <- as.table(rbind(pull(fiveSetsMatches, count), pull(lessThanFiveSetsMatches, count)))
colnames(data) <- c("Carpet", "Clay", "Grass", "Hard")
rownames(data) <- c("5 sets played", "Less than 5 sets played")
```

```
probabilities <- data[1, ] / data[2, ]
```

Sada provodimo test i gledamo ispise:

```
test <- chisq.test(data)
test$observed
```

```
##
##           Carpet  Clay Grass  Hard
## 5 sets played      186  1714  1377  1498
## Less than 5 sets played 1402 12052  8879 13483
```

```
test$expected
```

```
##
##           Carpet      Clay      Grass      Hard
## 5 sets played    186.8074  1619.39 1206.484  1762.319
## Less than 5 sets played 1401.1926 12146.61 9049.516 13218.681
```

```
test$residuals
```

```
##
##           Carpet      Clay      Grass      Hard
## 5 sets played   -0.05907485  2.35105300  4.90912192 -6.29630184
## Less than 5 sets played  0.02157003 -0.85844123 -1.79247029  2.29897203
```

```
test$stdres
```

```
##
##           Carpet      Clay      Grass      Hard
## 5 sets played   -0.06415712  3.07881622  6.04537198 -8.43863029
## Less than 5 sets played  0.06415712 -3.07881622 -6.04537198  8.43863029
```

```
test
```

```
##
## Pearson's Chi-squared test
##
## data:  data
## X-squared = 78.509, df = 3, p-value < 2.2e-16
```

S obzirom na to da je vrijednost svake ćelije frekvencija, da svaka observacija pripada jednoj ćeliji te da je očekivana vrijednost svake ćelije  $\geq 5$ , možemo zaključiti da su rezultati ovog testa validni te da vjerojatnost da će meč otići u 5. set ne ovisi o vrsti terena (jako mala P-vrijednost:  $2.2e-16$ )

## 6 7. istraživačko pitanje: Postoji li razlika u broju odigranih aseva između igrača koji su osvojili Grand Slam naslov i onih koji nisu?

### 6.1 Učitavanje podataka

Podatke ćemo učitati iz CSV datoteka u listu podatkovnih okvira. Svaki podatkovni okvir sadržava podatke mečeva jedne godine. Nakon toga spajamo sve podatkovne okvire u jedan te time imamo informacije o svim odigranim mečevima od 1968. do 2023. godine dostupne u jednom podatkovnom okviru. Iz tog okvira ćemo naknadno izvlačiti potrebne podatke za svrhe analize.

Proces učitavanja podataka je prikazan u sljedećem bloku koda:

```
matches <- fetch_data(1968:2023)
```

### 6.2 Prilagodba tipova podataka

Nakon učitavanja podataka, potrebno je ispraviti tipove podataka za neke stupce. Ti stupci su:

- **surface** - podloga na kojoj se igrao meč: trava, zemlja, tvrda podloga, tepih (eng. grass, clay, hard, carpet)

- `tourney_level` - razina turnira: Grand Slam, ATP Finals, ATP Masters 1000, ATP Tour, ATP Challengers
- `tourney_date` - datum održavanja turnira
- `winner_hand` - ruka s kojom je pobjednik igrao meč: desnoruk, lijevoruk, ambidekster, nepoznato (eng. right-handed ("R"), left-handed ("L"), ambidextrous ("A"), unknown ("U"))
- `loser_hand` - ruka s kojom je gubitnik igrao meč (definirano isto kao i za `winner_hand`)

Prilagodba tipova podataka je prikazana u sljedećem kodu:

```
matches$surface <- factor(
  matches$surface,
  levels = c("Grass", "Clay", "Hard", "Carpet")
)
matches$tourney_level <- factor(
  matches$tourney_level,
  levels = c("F", "A", "D", "M", "G")
)
matches$tourney_date <- ymd(matches$tourney_date)
matches$winner_hand <- factor(
  matches$winner_hand,
  levels = c("R", "L", "A", "U")
)
matches$loser_hand <- factor(
  matches$loser_hand,
  levels = c("R", "L", "A", "U")
)
```

## 6.3 Statistička analiza

### 6.3.1 Priprema podataka

Potrebne su nam dvije glavne grupe u koje ćemo podijeliti igrače:

- igrači s barem jednom osvojenom Grand Slam titulom
- igrači bez osvojene Grand Slam titule (u daljnjem tekstu ćemo ih nazvati “ostali igrači”)

Uz te dvije glavne grupe, stvorit ćemo dodatnu grupu za ostale igrače gdje ih dodatno filtriramo tako da uklonimo igrače koji su ukupno sudjelovali u manje od 7 mečeva. Budući da uspoređujemo prosjeke odigranih asova po meču, želimo izbjeći situacije gdje bi igrači koji su odigrali samo jedan ili dva meča imali velik utjecaj na prosjek cijele grupe. Budući da je za osvajanje titule potrebno odigrati i pobijediti u barem 7 mečeva (za grand slam turnire se inicijalno izvlači 128 sudionika), smatramo da je 7 mečeva minimalna granica koju igrač mora ispuniti da bi bio uključen u usporedbu s igračima koji su osvojili Grand Slam titulu. U daljnjem tekstu ćemo se na tu grupu referirati kao “ostali igrači ( $n \geq 7$ )” i odvojeno ju uspoređivati s igračima koji su osvojili Grand Slam titulu.

Proces izvlačenja i pripreme podataka je prikazan i komentiran u sljedećem bloku koda:

```
# izrada novog okvira s podacima o svim igračima (ID, ime, broj asova)
all_players <- matches %>%
  dplyr::select(winner_id, winner_name, w_ace) %>%
  rename(id = winner_id, name = winner_name, aces = w_ace) %>%
  bind_rows(matches %>%
    dplyr::select(loser_id, loser_name, l_ace) %>%
    rename(id = loser_id, name = loser_name, aces = l_ace))

# uklanjanje unosa za koje ne postoje podatci o broju odigranih asova
all_players <- all_players %>%
  filter(!is.na(aces))

# grupiranje igrača po ID-u i imenu te izračun prosjeka asova po meču (APM)
all_players <- all_players %>%
```

```
group_by(id, name) %>%
  summarise(aces = sum(aces), matches = n()) %>%
  mutate(apm = aces / matches)
```

## `summarise()` has grouped output by 'id'. You can override using the `.groups` argument.

```
# filtriranje igrača koji su odigrali >=7 mečeva
filter_players <- all_players %>%
  filter(matches >= 7)

# izrada okvira za igrače s naslovom (pobjeda u finalu Grand Slam turnira)
gs_winners <- matches %>%
  filter(tourney_level == "G" & round == "F") %>%
  dplyr::select(winner_id, winner_name) %>%
  rename(id = winner_id, name = winner_name) %>%
  distinct(id, name)

# dodavanje stupca s prosjekom asova po meču (apm) za igrače s naslovom
gs_winners <- gs_winners %>%
  left_join(all_players, by = c("id", "name")) %>%
  filter(!is.na(apm))

# izrada okvira za ostale igrače (bez naslova)
gs_others <- all_players %>%
  filter(!id %in% gs_winners$id)

# izrada okvira za ostale igrače uz uvjet da su odigrali barem 7 mečeva
gs_filter1 <- filter_players %>%
  filter(!id %in% gs_winners$id)

# brisanje privremenih okvira koji su nepotrebni u daljnjem radu
rm(filter_players)
```

### 6.3.2 Deskriptivna statistika

Sada kada imamo podatke na kojima možemo provoditi analizu, izračunat ćemo osnovne deskriptivne statistike za svaku od grupa. Izračunat ćemo sljedeće vrijednosti:

- prosjek asova svake grupe
- medijan asova
- standardnu devijaciju asova
- minimalnu vrijednost asova svake grupe
- maksimalnu vrijednost asova svake grupe
- ukupan broj odigranih mečeva za svaku grupu
- prosjek asova po meču (APM) cijele grupe
- broj igrača u svakoj grupi

Table 3: Servirani asovi po grupama

id	mean_aces	median_aces	sd_aces	min_aces	max_aces	total_matches	group_apm	players
Grand Slam pobjednici	3703.77	3452	2982.47	0	11420	23677	6.73	43
Ostali igrači	386.25	23	1013.12	0	14663	165274	5.53	2368
Ostali igrači (n>=7)	764.82	237	1329.93	1	14663	162536	5.57	1183
Svi igrači	445.42	25	1164.47	0	14663	188951	5.68	2411

Uz tablicu s deskriptivnim statistikama, možemo i vizualizirati podatke kako bismo dobili bolji uvid u njih. Za to ćemo koristiti boxplotove za broj asova i srednje vrijednost asova po mečevima (APM) igrača te dijagrame gustoće za prosjek asova po meču kako bismo dobili uvid u distribuciju podataka. Za svaku od grupa ćemo izraditi zasebne vizualizacije kako bismo mogli usporediti podatke između grupa. Uz to, izradit ćemo i vizualizacije za sve igrače kako bismo dobili uvid u distribuciju podataka za cijelu populaciju igrača.

Boxplotovi broja asova i APM-ova za svaku grupu:

Iz boxplot dijagrama možemo vidjeti kako je distribucija asova igrača jako nakošena na lijevu stranu te kako ima jako puno ekstremnih vrijednosti, što i ima smisla jer broj asova ultimativno ovisi o ukupnom broju mečeva koje je igrač odigrao tijekom svoje karijere.

Zbog toga ćemo usporedbu broja asova između grupa raditi kroz srednju vrijednost asova po mečevima (APM) igrača. Kroz APM dobivamo jedinstvenu mjeru koja ne ovisi o broju mečeva koje je igrač odigrao te je stoga pogodnija za usporedbu između grupa.

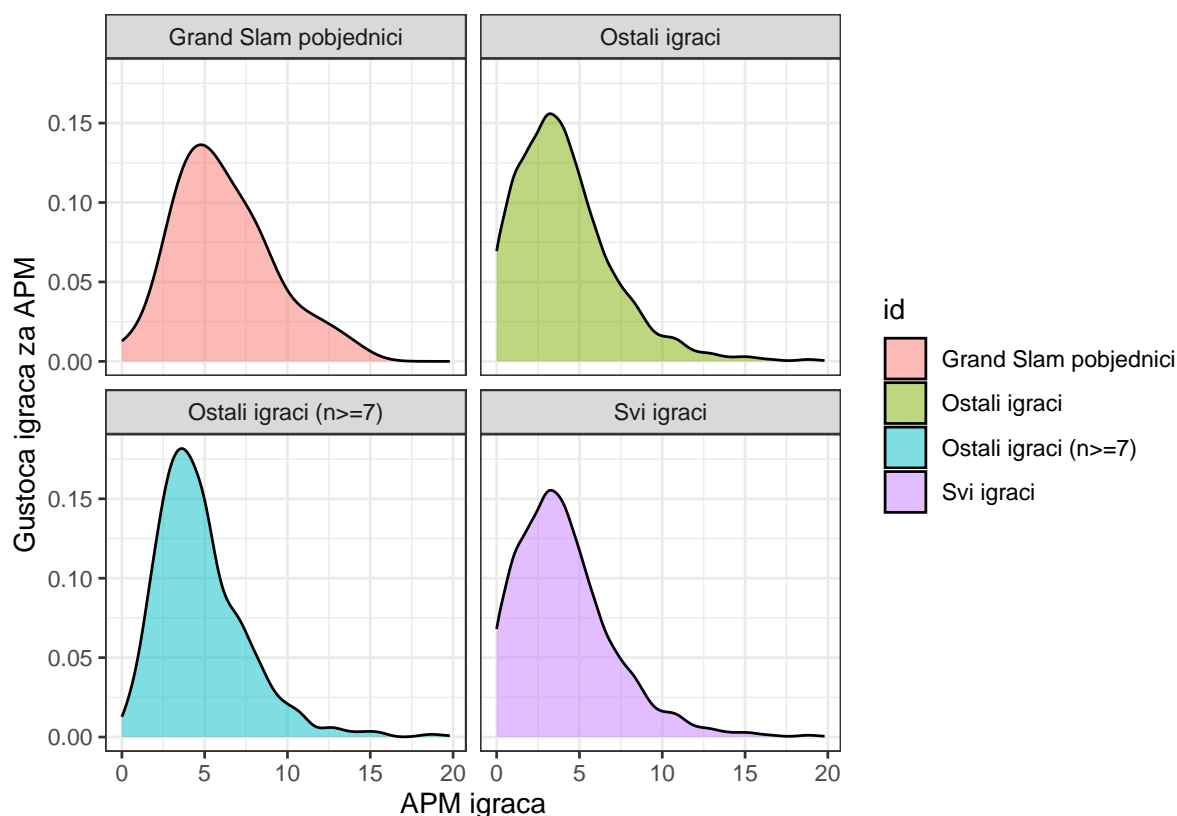

U boxplot dijagramu APM-ova možemo stoga primijetiti kako su distribucije APM-ova puno manje nakošene te imaju puno manje ekstremnih vrijednosti.

Deskriptivna statistika APM-ova za svaku grupu je sljedeća:

Table 4: APM igrača po grupama

id	mean_apm	median_apm	sd_apm	min_apm	max_apm	n_players
Grand Slam pobjednici	6.135	5.629	2.968	0.0	13.859	43
Ostali igrači	4.080	3.667	2.926	0.0	19.801	2368
Ostali igrači (n>=7)	4.791	4.300	2.709	0.1	19.801	1183
Svi igrači	4.117	3.667	2.938	0.0	19.801	2411

Kako bismo dobili bolji uvid u samu distribuciju APM-ova grupa, izradit ćemo dijagrame gustoće za svaku grupu:

Iz dijagrama gustoća svake od grupa možemo vidjeti kako su podatci uistinu još uvijek lijevo nakošeni te vjerojatno nisu normalno distribuirani. Zbog toga ćemo prvo trebati provjeriti normalnost podataka kako bismo mogli odlučiti koje testove ćemo koristiti za usporedbu grupa.

### 6.3.3 Statističko testiranje

Nakon vizualnog uvida u podatke i izračunatih deskriptivnih statistika, možemo započeti statističko testiranje kako bismo dobili odgovor na temeljno pitanje ovog istraživanja: *Postoji li razlika u broju odigranih aseva između igrača koji su osvojili Grand Slam naslov i onih koji nisu?*

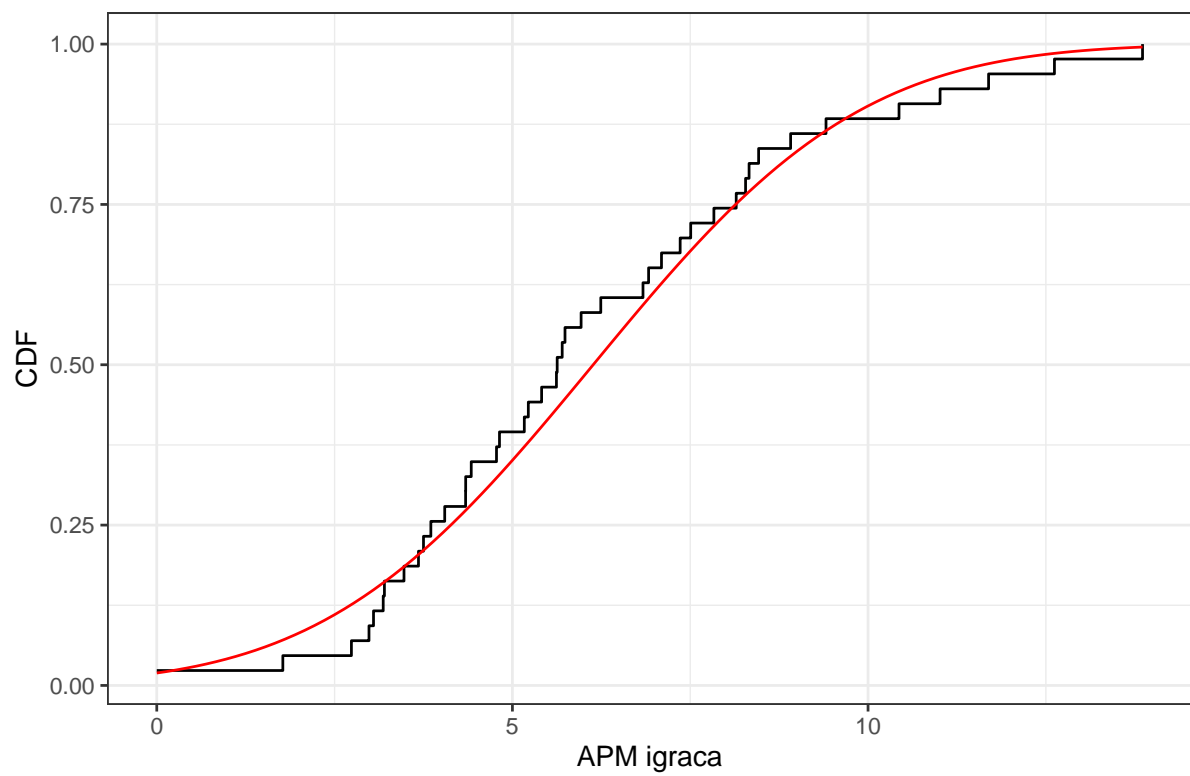

**6.3.3.1 Normalnost uzoraka** Kako bismo odlučili hoćemo li koristiti parametarske ili neparametarske testove, potrebno je provjeriti normalnost podataka. Za to ćemo iskoristiti Kolmogorov-Smirnovljev test. Budući da smo već ranije zaključili da je APM pogodniji za usporedbu grupa, provjerit ćemo normalnost samo za APM-ove.

Prije provođenja Kolmogorov-Smirnovljevog testa postavljamo sljedeće hipoteze:

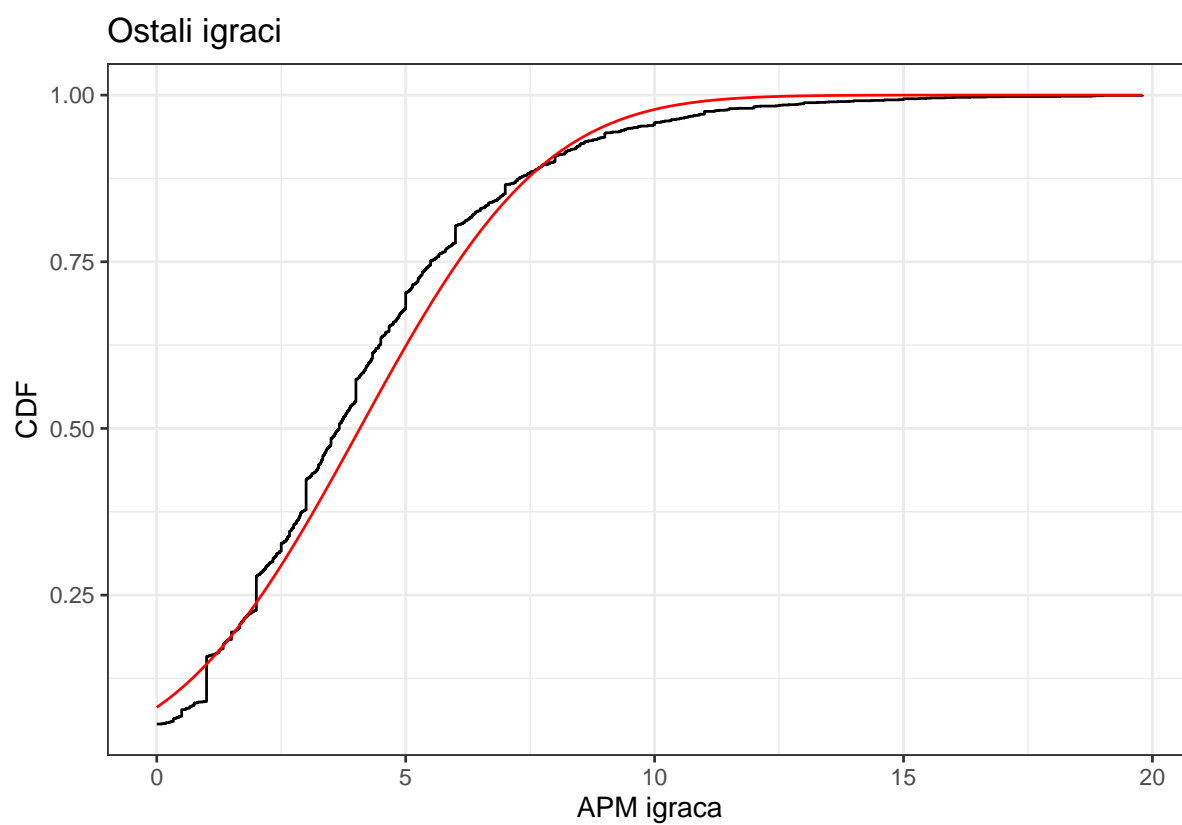

- $H_0$ : Podatci su normalno distribuirani
- $H_1$ : Podatci nisu normalno distribuirani

Za test uzimamo razinu značajnosti od 0.05.

## Grand Slam pobjednici

```
##  
## Exact one-sample Kolmogorov-Smirnov test  
##  
## data: gs_winners$apm  
## D = 0.11126, p-value = 0.6216  
## alternative hypothesis: two-sided
```

```
##  
## Exact one-sample Kolmogorov-Smirnov test  
##  
## data: gs_others$apm  
## D = 0.084809, p-value = 1.954e-14  
## alternative hypothesis: two-sided
```

```
##
## Exact one-sample Kolmogorov-Smirnov test
##
## data: gs_filter1$apm
## D = 0.09568, p-value = 7.062e-10
## alternative hypothesis: two-sided
```

Kao što možemo vidjeti iz dijagrama i rezultata Kolmogorov-Smirnovljevog testa, jedino uzorak igrača s Grand Slam naslovom prolazi test normalnosti, dok ostali, zbog činjenice da su uzorci puno veći, ne prolaze test te za njih odbacujemo  $H_0$  hipotezu uz razinu značajnosti od 0.05.

Zbog toga ćemo morati koristiti neparametarske testove za usporedbu grupa.

**6.3.3.2 Neparametarsko testiranje** Sada kada smo utvrdili da su uzorci nenoormalno distribuirani, možemo koristiti neparametarske testove za usporedbu grupa. Budući da uspoređujemo dvije grupe, koristit ćemo Mann-Whitney U test. Prije provođenja testa postavljamo sljedeće hipoteze:

- $H_0$ : Nema razlike u prosjeku APM-ova između grupa (uzorci dolaze iz iste populacije)
- $H_1$ : Postoji razlika u prosjeku APM-ova između grupa (jedan uzorak stohastički dominira)

Za ovaj test također uzimamo razinu značajnosti od 0.05.

```
##
## Wilcoxon rank sum test with continuity correction
##
## data: gs_winners$apm and gs_others$apm
## W = 72232, p-value = 2.427e-06
## alternative hypothesis: true location shift is not equal to 0

##
## Wilcoxon rank sum test with continuity correction
##
## data: gs_winners$apm and gs_filter1$apm
## W = 32977, p-value = 0.0009439
```

```
## alternative hypothesis: true location shift is not equal to 0
```

Kao što možemo vidjeti iz rezultata testa, u oba slučaja odbacujemo  $H_0$  hipotezu uz razinu značajnosti od 0.05. To znači da postoji razlika u prosjeku APM-ova između grupa igrača s osvojenim Grand Slam naslovom i ostalih igrača. Uz to, možemo primijetiti kako je razlika u prosjeku APM-ova između uzorka igrača s naslovom i ostalih igrača puno veća nego između uzorka igrača s naslovom i filtriranih ostalih igrača.

## 6.4 Zaključak

U ovom istraživanju smo pokušali odgovoriti na pitanje postoji li razlika u broju odigranih aseva između igrača koji su osvojili Grand Slam naslov i onih koji nisu. Kako bismo odgovorili na to pitanje, analizirali smo podatke o svim odigranim mečevima od 1968. do 2023. godine. Nakon pripreme podataka, izračunavanja deskriptivnih statistika i vizualizacije podataka, zaključili smo da postoji razlika u prosjeku APM-ova između igrača koji su osvojili Grand Slam naslov i onih koji nisu. Uz to, možemo primijetiti kako je razlika u prosjeku APM-ova između uzorka igrača s naslovom i ostalih igrača puno veća nego između uzorka igrača s naslovom i filtriranih ostalih igrača. Iz toga možemo zaključiti da postoji razlika u broju odigranih aseva između igrača koji su osvojili Grand Slam naslov i onih koji nisu te da je ta razlika puno veća nego što se može objasniti činjenicom da igrači koji su osvojili Grand Slam naslov imaju više odigranih mečeva od ostalih igrača. Iz toga možemo zaključiti da bi broj odigranih aseva mogao biti jedan od faktora koji utječu na osvajanje Grand Slam naslova.
